

Coregenix Article 1 - Your Office Has a Chowkidar. Your IT Infrastructure Doesn't.

A CoreGenix Perspective | coregenix.in

Every office in India has one.

He sits at the gate sharp eyes, visitor register in hand, sometimes a walkie-talkie he barely uses. He knows every face that belongs there. He questions the ones that don't. He locks up at night.

You hired him without a second thought, because leaving your office unguarded felt irresponsible.

So here's the question nobody asks out loud:

Why do most Indian businesses guard their office gate more seriously than their IT infrastructure?

The Building You Can't See Is the One That Gets Robbed

Your office has walls. It has a gate. If someone breaks in, you hear it. You see it. You call someone.

Your IT infrastructure, your servers, your cloud, your endpoints, your network has none of that by default. It has doors without guards, windows without locks, and corridors that stretch across continents.

And unlike a physical break-in that happens in minutes, a cyber intrusion can go undetected for **197 days on average** before anyone notices.

197 days.

That's not a breach. That's a tenant who moved in, set up furniture, and has been reading your files over morning chai every day for six months.

The Mindset Gap That's Costing Indian Businesses Crores

We've spent 18+ years working with Indian enterprises across manufacturing, BFSI, healthcare, logistics, and government — and we've seen the same pattern repeat itself.

A company will spend ₹40 lakhs on CCTV cameras, access control, and physical security without blinking.

Then baulk at ₹4 lakhs a year for endpoint detection, network monitoring, and a managed SOC.

Why?

Because physical security *feels* real. A camera you can see. A lock you can touch. A guard you can greet every morning.

Cybersecurity feels abstract until the morning your ERP system won't open, your customer data is on a dark web forum, and someone is asking for ₹50 lakh in Bitcoin to give you your own files back.

That morning, it stops feeling abstract very quickly.

OT Environments: The Blind Spot Nobody Talks About

Here's where it gets more specific — and more urgent.

India's manufacturing sector is booming. Factories are getting smarter. PLCs, SCADA systems, IoT sensors, and industrial control systems are now connected to the internet in ways they never were before.

The engineers who built those systems built them to run efficiently. They were not built to be secure. They were never meant to face the open internet.

But they do now.

And when an attacker finds a way into your OT environment, they're not just stealing data. They can halt a production line. They can manipulate a process. They can create physical, real-world consequences — the kind your chowkidar cannot stop, no matter how alert he is.

This is not a future problem. It is happening now, to Indian companies, in Indian industrial zones.

What a Modern IT Security Posture Actually Looks Like

It doesn't have to be complicated. Think of it like your office building.

Physical Security	IT Security Equivalent
Chowkidar at the gate	Firewall & perimeter security
CCTV cameras	SIEM & log monitoring
Visitor register	Identity & access management
Alarm system	Endpoint Detection & Response (EDR/XDR)
Security audit	VAPT — Vulnerability Assessment & Pen Testing

Emergency response plan	Incident Response & BCP/DR plan
-------------------------	---------------------------------

Every layer of your physical security has a digital equivalent. The question is whether yours are in place, monitored, and tested.

The Uncomfortable Truth About "We Haven't Been Attacked Yet"

We hear this often.

"We've been running for 15 years, and nothing has happened."

With respect, that's not a security strategy. That's luck.

And the threat landscape in 2025 is not what it was five years ago. Ransomware-as-a-Service means a 19-year-old with a laptop can now deploy the same attack that once required a nation-state. AI-generated phishing emails have become indistinguishable from real ones. And with the Digital Personal Data Protection Act now in force in India, a breach isn't just a business problem — it's a compliance and legal one.

The companies that wait for an attack to justify investing in security are the ones writing the crisis press releases.

What We Do at CoreGenix

We don't sell fear. We build defences.

For 18+ years, we have helped Indian enterprises across every sector design, deploy, and manage IT infrastructure that is not just functional — but resilient.

That means:

- **VAPT & Security Audits** — finding your vulnerabilities before attackers do
- **NOC & SOC Services** — 24/7 eyes on your network, so you never fly blind
- **EDR/XDR Deployment** — endpoint protection that actually detects and responds
- **OT/IT Security** — securing the industrial environments that keep your operations running
- **Cloud Security** — locking down Azure, AWS, and GCP environments that are often dangerously misconfigured
- **ISO 27001 & InfoSec Compliance** — because good security and good governance go together
- **Managed Support & FMS** — so your team has backup, always

We are ISO 27001 certified. We are a Microsoft partner. And we work with organisations from mid-market enterprises to large industrial groups across India.

One Question to End With

You wouldn't run your office for a single day without your chowkidar.

How many days has your IT infrastructure been running without one?

If the answer makes you uncomfortable, let's talk.
