

LinkedIn Article 1:

What Happens If Your Server Goes Down for 24 Hours?

Most businesses think downtime is a minor inconvenience.
Until they see what 24 hours actually costs.
But here's the reality:

Even the best systems don't guarantee 100% uptime.
Most operate between 99% uptime, which still allows for downtime.

1. Immediate Revenue Loss

According to industry research:

Small - mid businesses lose \$137-\$427 per minute
Average cost can reach \$5,600 per minute globally

That's:

₹6-20 lakh per hour
₹1.5+ crore in 24 hours

2. Costs Don't Stop When Systems Do

Downtime doesn't pause salaries or operations.

Businesses still incur:

- Employee costs
- Delayed deliverables
- Operational inefficiencies

Even short outages can create a significant financial impact.

3. The Hidden Costs Add Up Fast

Downtime isn't just lost revenue. It triggers:

- Missed business opportunities
- Delayed workflows
- Recovery and rework costs
- Customer dissatisfaction

In many cases, a single incident can exceed \$100,000.

4. Even High Uptime Has Gaps

99% uptime sounds reliable, but it still allows ~8 hours 45 minutes of downtime annually.

Now imagine that downtime happening all at once.

5. The Real Damage: Trust

Downtime impacts more than operations:

- Customer confidence drops
- Brand perception takes a hit
- Future revenue is affected

And recovery isn't always immediate.

Reality Check

Downtime is not just an IT issue.
It's a business continuity risk.

What Smart Companies Do Differently

- ✓ Proactive monitoring (not reactive fixes)
- ✓ Backup & disaster recovery systems
- ✓ Cloud redundancy & failover setups
- ✓ Security-first infrastructure

Honest question:

If your systems go down today...

Do you have a tested recovery plan or just assumptions?

Comment *PLAN*, we'll help you assess it.
