

LinkedIn Article 1:

What Happens If Your Server Goes Down for 24 Hours?

Most businesses think:
It's just a temporary issue.

Let's break that down with real numbers.

1. Immediate Revenue Loss

According to industry research:

Small-mid businesses lose \$137-\$427 per minute
Average cost can reach \$5,600 per minute globally

That's:

₹6-20 lakh per hour
₹1.5+ crore in 24 hours

2. You Still Pay Employees (Even When Work Stops)

Downtime doesn't pause salaries.

Businesses calculate losses using:

$(\text{Hourly payroll} + \text{lost revenue}) \times \text{downtime hours}$

Even a 3-hour outage can cost \$15,000+ in combined impact.

3. The Invisible Costs Are Bigger Than You Think

Downtime triggers a chain reaction:

1. Missed deals
2. Delayed operations
3. Recovery & rework costs
4. Customer churn

Many organisations report single incidents exceeding \$100,000.

4. Even 99.9% Uptime Isn't Safe

Sounds reliable... but:

99.9% uptime = ~8 hours 45 minutes downtime per year

Now imagine 24 hours straight.

5. The Real Damage: Trust & Reputation

Downtime doesn't just cost money.

It creates:

1. Customer frustration
2. Brand damage
3. Lost future revenue

And in many cases, customers don't come back.

Reality Check

Downtime is not an IT problem.

It's a business survival problem.

What Smart Companies Do Differently:

- ✓ Proactive monitoring (not reactive fixes)
- ✓ Backup & disaster recovery systems

- ✓ Cloud redundancy & failover setups
- ✓ Security-first infrastructure

Honest question:

If your server goes down right now...

How long can your business actually survive?
